This parking management solution incorporates the use of Radio Frequency Identification (RFID) technology as the foundation of the system. RFID technology is an automated, wireless technology that SmarterParking has captured and coupled with its unique parking management software to create a system superior to those today.

WHY IS IT SMARTER?

SmarterParking is unique from other parking monitoring systems in that the parking location is able to maintain an open parking design. This is achieved with various sensors coupled with the RFID technology to determine if unregistered vehicles enter the monitored location as well as RFID registered vehicles, thus eliminating unprofitable gate restrictions.

OTHER FEATURES

Client side intranet website - allows parking management to view real-time data of any parking location, search and locate any registered vehicle with the convenience of never leaving the office, as well as display all legally parked vehicles within the monitored locations.

BENEFITS AND ADVANTAGES

- Wireless
- Real-time information exchange
- Improved monitoring of parking locations
- Improved efficiency of distributing tickets
- Open parking lot design
- Increased customer satisfaction

Other features that make our system "smarter" than other parking management solutions are the technological benefits provided to the user of the parking lots. These benefits include on site parking availability LED displays, website interface for remote viewing of space availability, and a unique cell phone messaging service for customers who are on a tight schedule.
